

L^AT_EX for Logicians

Branching quantifiers

Use the amsmath package, and then you can write, e.g.

```
\begin{equation}\label{eqn2}  
\begin{pmatrix}  
\forall x \exists y \\\br/>\forall x' \exists y' \\\br/>\end{pmatrix}  
((x = x' \rightarrow y = y') \wedge R(x,y) \wedge R(x',y'))  
\end{equation}
```

to get

$$\left(\begin{matrix} \forall x \exists y \\ \forall x' \exists y' \end{matrix} \right) ((x = x' \rightarrow y = y') \wedge R(x, y) \wedge R(x', y')) \quad (1)$$
